What is ByCore?

ByCore is an innovative Bio product designed for the world of footwear, leather goods and clothing.

How is it made?

We use the stone of the olives after the production of EVO oil: Italy is a great producer of it. After the cold pressing, the mill faces a big waste of this stones known as "solid" virgin pomace. We collect this waste from Central and Southern Italy, because olive trees grow on the mediterranean part of the peninsula, and then we proceed in chopping it. After this process, the ganules obtained are ground in a fine dust and then transformed into an ecological coating with a minimum of polyurethane base derived from renewable sources.

How does it look?

ByCore combines this innovative Bio PU coating with recycled fabrics as base, obtaining a totally vegan material. It is an evolutive step about the recycled materials we offer. EMM managed again to use another natural waste recycling, processing, and making it reusable. It is suitable for many applications and looks like a synthetic leather with a width of 140cm.
